

PSMCs from real life

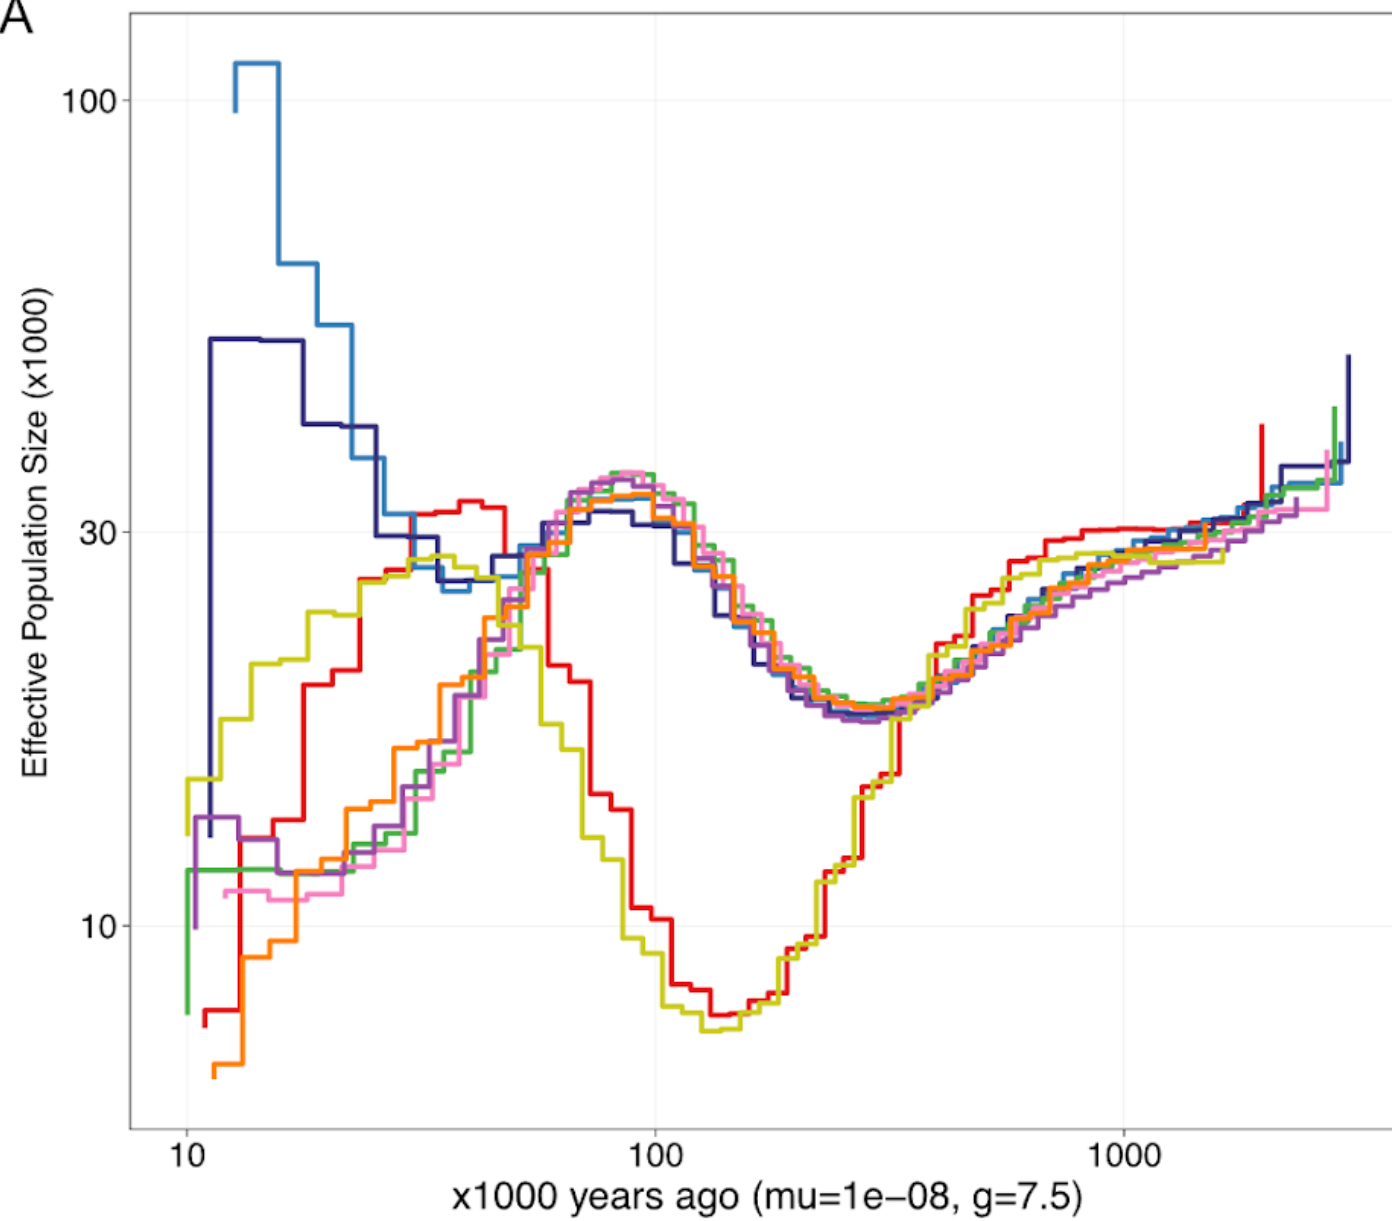

And other demographic analyses

Questions

- At which time point does black and blue wildebeest stop having the same demographic history?
- Why is the population size the same for all populations prior to this time?
- Which two populations appear to have had the lowest “long term” effective population size if we average across all time?
- How would you expect this to manifest itself in the genetic diversity?

A

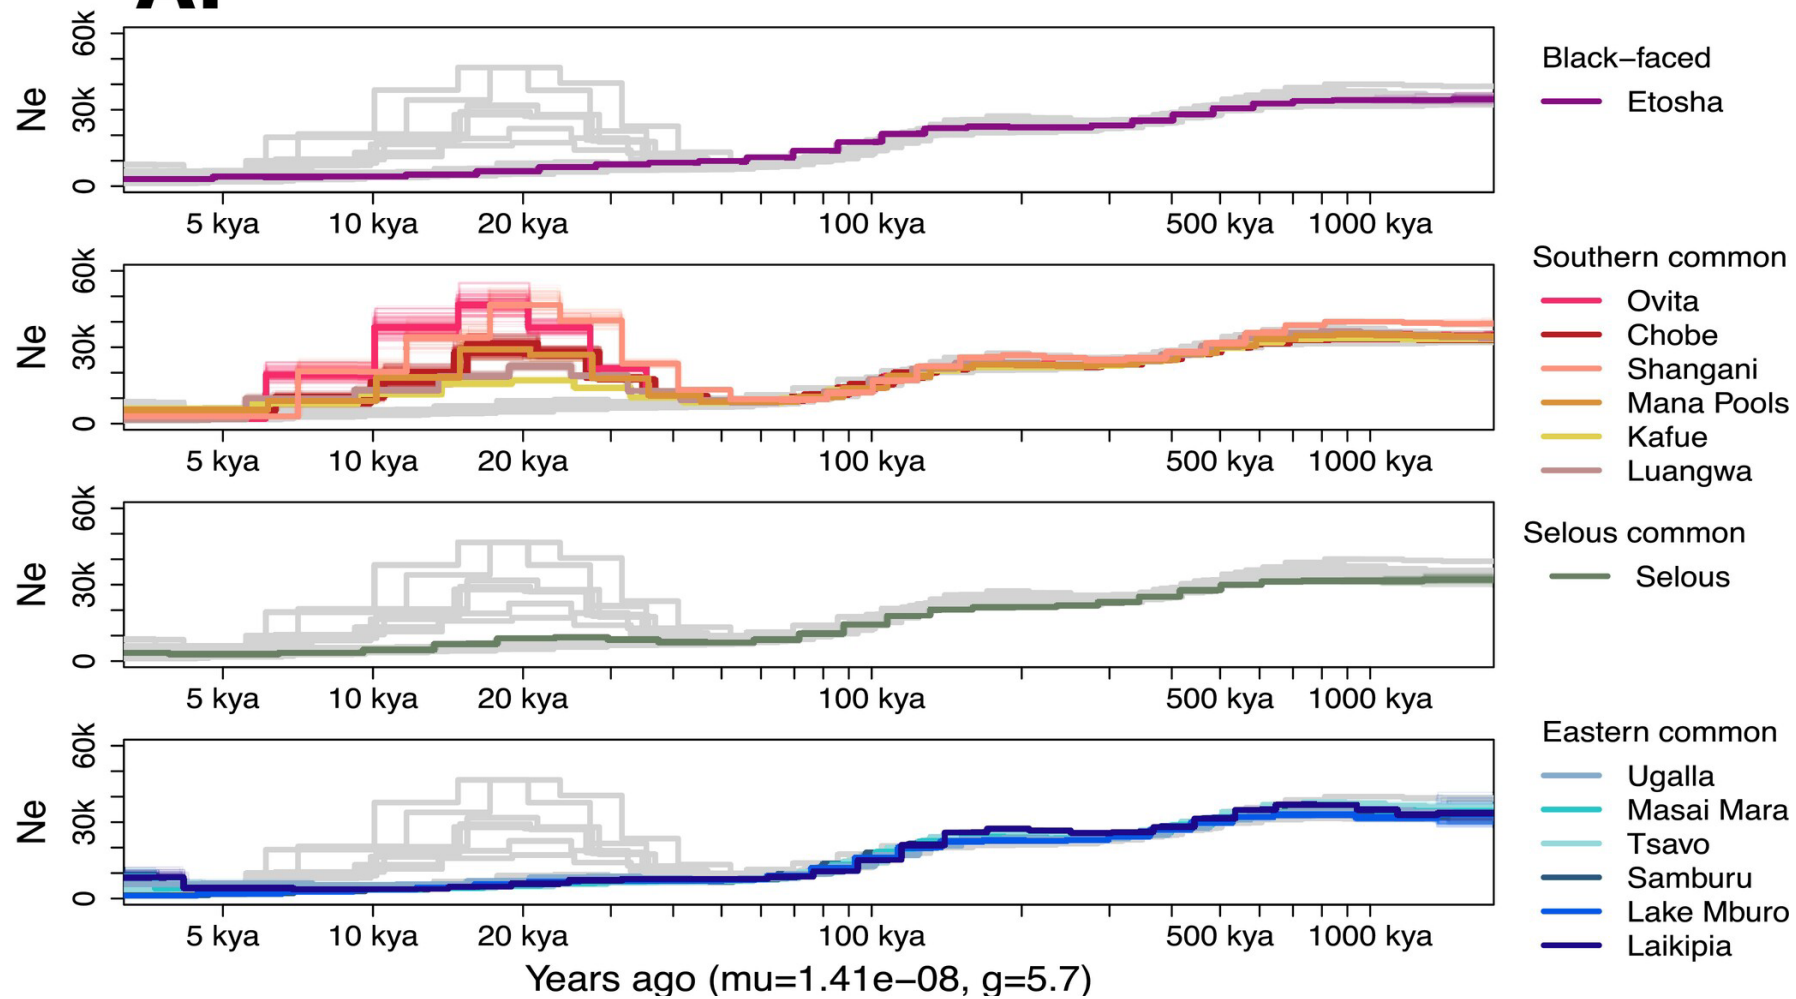

population

- EthiopiaW
- EthiopiaSW
- Kenya
- TanzaniaUgalla
- Uganda
- Zambia
- Botswana

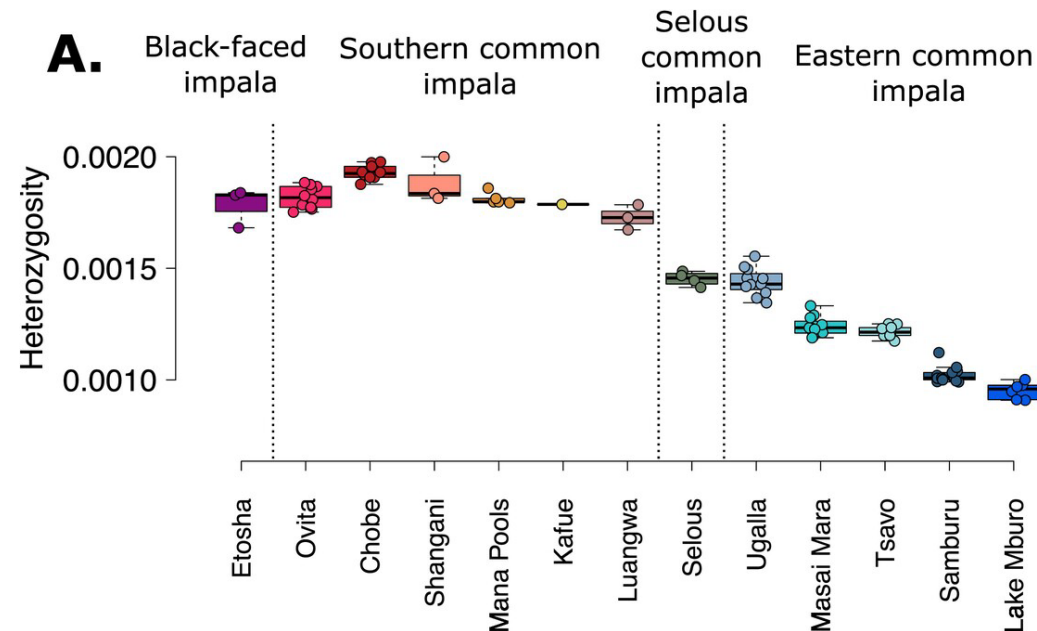

Questions

- What is the main difference in demographic history between populations in Tanzania and northwards compared to those to the south of here?
- How would you expect genetic diversity to differ between the populations?
- Would you say these differences are large enough to consider them different species? Different ESUs? Different MUs? How would you check or verify this?

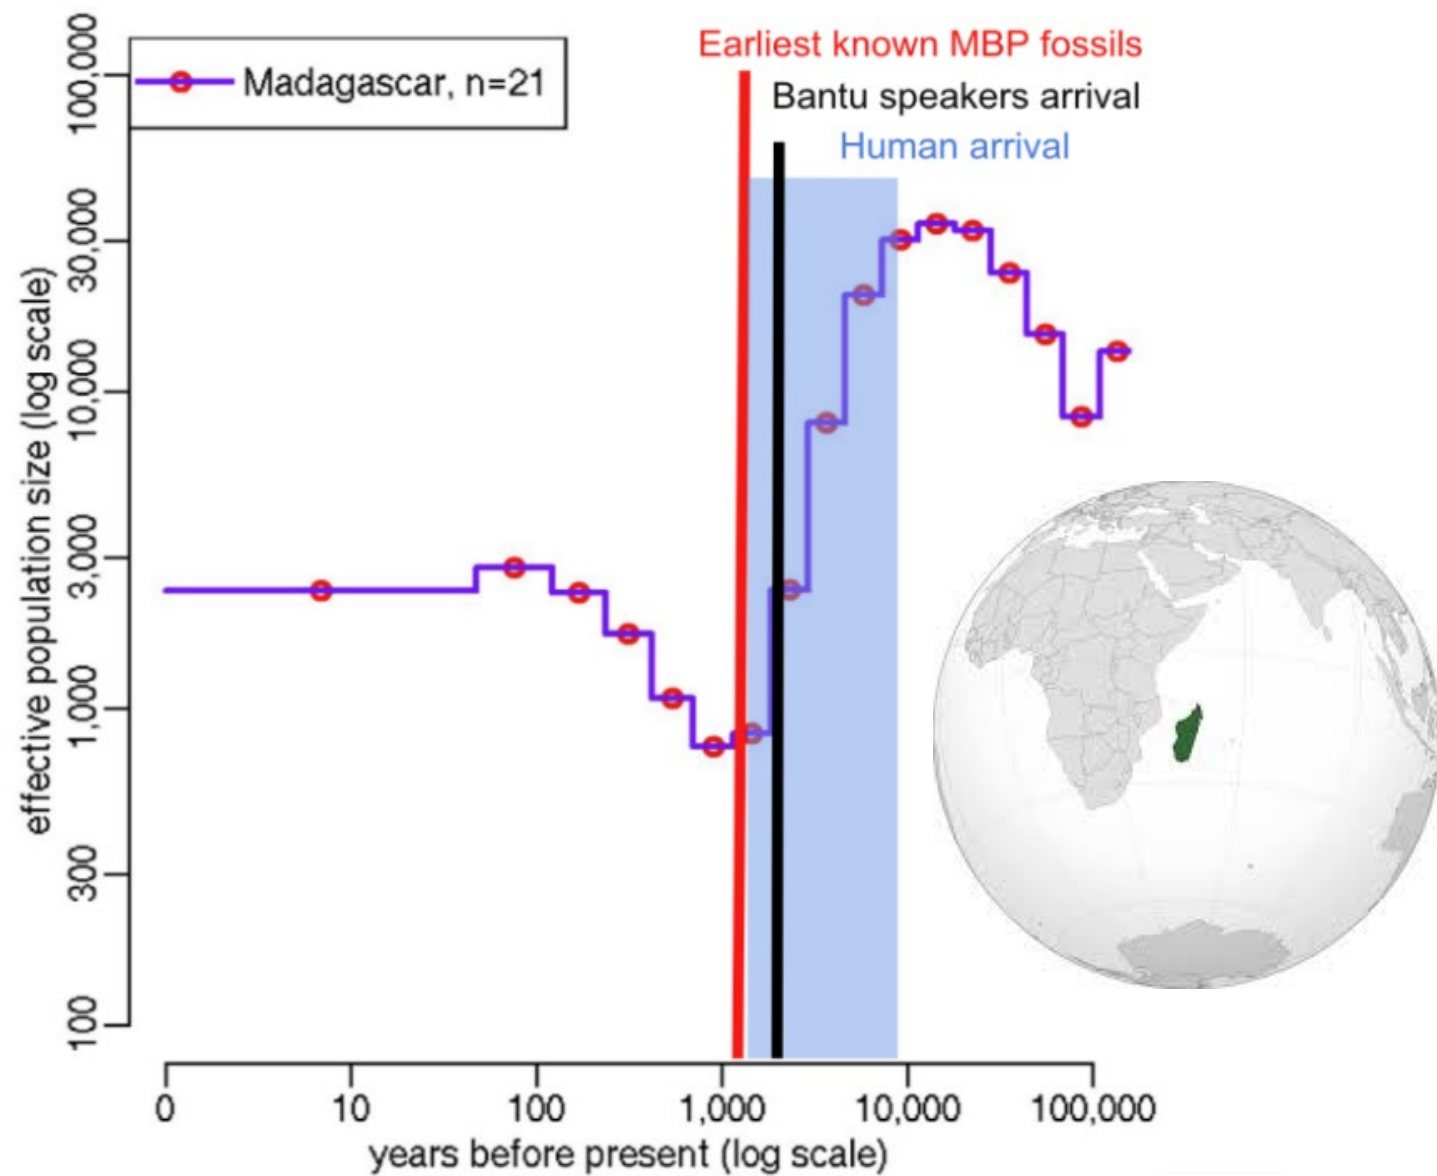

A.

Questions

- Compare the differences seen here with those in the topi – do they follow the same geographic pattern?
- Here is the genetic diversity in impalas. Formulate a preliminary conservation management recommendation for them.

c

Questions

- What is the most conspicuous feature of Malagasy bushpig demographic history?
- What is the support for a human introduction of bushpigs to Madagascar vs. a natural colonization event?
